AI-native products covered

42

Real-world coverage for RAG, multi-agent systems, AVs & robotics.

De-risk your agentic AI stack.

AI-native coverage for teams shipping autonomous agents, RAG systems, and AI-first products. Translate model, data, and workflow risk into clear, predictable insurance.

✓ Built for RAG, agents & AVs ✓ Designed with AI security & risk teams

Coverage designed for agentic AI systems

From hallucinating copilots to unsupervised multi-agent workflows, AI Agent Insure turns complex technical failure modes into clear, underwritten coverage.

Agentic AI Liability

Covers downstream harm from autonomous or semi-autonomous AI decisions, including hallucinations, misaligned actions, and faulty recommendations.

- Customer-facing and internal agents
- RAG-based copilots and assistants
- Regulatory & reputational protection

Autonomous Systems & Robotics

Purpose-built coverage for AVs, drones, warehouse robotics, and industrial automation controlled by AI.

- Navigation & perception failures
- Hardware–software integration issues
- Operational downtime add-ons

Model, Data & Infra Security

Protects your AI stack: training data, embeddings, vector stores, model endpoints, and orchestration layers.

- Prompt injection & data poisoning
- Model exfiltration and endpoint abuse
- Vector DB & RAG corruption incidents

Why AI-native insurance now?

Traditional cyber and E&O products were not built for agentic systems that act, learn, and route tasks autonomously. As your AI surface area grows, blind spots multiply.

AI Agent Insure translates failure modes your engineers and risk teams talk about every day into an underwriting language your board and regulators understand.

Built around how you ship AI

- Underwriting aligned to your RAG & agent architecture
- Coverage that evolves with new models and tools
- Support for internal, customer-facing, and partner-facing agents

How it works

01

Map your agentic risk surface

We work with your engineering, security, and legal teams to inventory models, data flows, agent workflows, and critical dependencies.

02

Design coverage around your stack

We align policy structure to how your systems actually behave: RAG pipelines, tool-calling agents, autonomous vehicles, and multi-agent orchestrators.

03

Deploy & iterate with you

As you ship new agents, swap models, or expand into new geos, we revisit limits, exclusions, and incident playbooks with your team.

Ready to insure your next generation of AI agents?

Share a brief snapshot of your AI footprint — models, agents, and infrastructure — and our team will respond with a tailored coverage outline.
